A,Description: Human Tyro3 gene and pseudogene in chromosome 15
A;Reference number: S32219
F;42-890/Product: protein-tyrosine kinase tyro3 #status predic
F;60-119/Domain: immunoglobulin homology <IMM1>
F;156-205/Domain: immunoglobulin homology <IMM2>
F;156-205/Domain: fibronectin type III repeat homology <FN3A>
F;322-405/Domain: fibronectin type III repeat homology <FN3B>
F;429-491/Domain: transmembrane #status predicted <TMM>
F;429-491/Domain: brotein kinase homology <KIN>
F;516-793/Domain: protein kinase homology <KIN>
F;524-532/Region: protein kinase ATP-binding motif
F;63,191,230,240,293,366,380/Binding site: carbohydrate (Asn)

Down syndrome cell adhesion protein 1 - human (fragment)
N;Alternate names: Down syndrome cell adhesion molecule
N;Alternate names: Down syndrome cell adhesion molecule
C;Species: Homo sapiens (man)
C;Date: 11-Jun-1999 #sequence_revision 11-Jun-1999 #text_change 11-Jun-1999
C;Accession: T08851
R;Yamakawa, K; Hubo, Y.K.; Haendel, M.A.; Hubert, R.; Chen, X.N.; Lyons, G.E.; Korer
submitted to the EMBL Data Library, September 1997
A;Description: DSCAM: A novel member of the immunoglobulin superfamily maps in a down; A;Reference number: 216495
A;Accession: T08851
A;Status: preliminary; translated from GB/EMBL/DDBJ

C;Comment: This is one of the short forms (S1a and S1b) of the human proactin receptor 90 ta-casein gene promoter activation, with S1b more effective than S1a. However, their ligital-casein gene promoter activation, with S1b more effective than S1a. However, their ligital-casein gene promoter activation, with S1b more effective than S1a.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A; Molecule type: DNA

C;Comment: This is one of the short forms (S1a and S1b) of the human prolactin receptor eta-casein gene promoter activation, with S1a less effective than S1b. However, their lited COS-1 and HEK293 cells is due to rapid intracellular turnover of the receptor. #expe

epincarion: Fundamental academic activation may activation necessitate an association with ILGST. Activation may activation necessitate an association with ILGST. Activation may lead to the regulation of the immune response, acute-phase lead to the regulation of the immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reactions and hematopoiesis.

FUNCTION: Low concentration of a soluble form (
FUNCTION: Low concentration of IL6 activity.

receptor acts as an agonist of IL6 activity.

SUBUNIT: Hexamer of two molecules each of IL6,

SUBCELLULAR LOCATION: Type I membrane protein

Secreted (isoform 2).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              357
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: Part of the receptor for interleukin 6. Binds to II with low affinity, but does not transduce a signal. Signal activation necessitate an association with IL6ST. Activation lead to the regulation of the immune response, acute-phase reactions and hematopoiesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBCELLULAR LOCATION: Type I membrane protein.
SUBCELLULAR LOCATION: Type I membrane protein.
DOWAIN: The two fibronectin type III-like domains contained in the DOWAIN: The two fibronectin type III-like domains contained in the DOWAIN: The ways motif appears to be necessary for proper protein DOWAIN: The Ways motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-folding and thereby efficient intracellular transport.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: Hexamer of two molecules each of IL6, IL6R and IL6ST
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY: Belongs to the type I cytokine family of Similarity: Belongs to the type I cytokine family of Similarity: Contains 1 fibronectin type III domain.
SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
SIMILARITY: Contains 1

DOMAIN: The two fibronectin type III-like domains contained in the C-terminal part form together a cytokine-binding domain.

DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-surface receptor binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             rillo M.T., Ciliberto G., Dente L.;
mitted (UUL-1990) to the EMBL/GenBank/DDBJ databases.
mitted(UUL-1990) to the receptor for interleukin 6. Binds to IL-6
with low affinity, but does not transduce a signal. Signal
activation necessitate an association with IL6ST. Activation may
lead to the regulation of the immune response, acute-phase
reactions and hematopoiesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 reactions and hematopoiesis.
SUBUNIT: Hexamer of two molecules each of IL6,

SUBCELLULAR LOCATION: Secreted.

SUBCELLULAR LOCATION: Secreted.
SIMILARITY: Belongs to the IL-6 superfamily.

SUBCELLULAR LOCATION: Secreted.
SUBCELLULAR LOCATION: Secreted.
SIMILARITY: Belongs to the II-6 superfamily.

Immunol. 155:3946-3954 (1995).

-!- FUNCTION: IL-6 is a cytokine with a wide variety of biologics functions: it plays an essential role in the final differenti of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, hepatocytes it induces acute phase reactants.

-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=96003435; PubMed=7561102;

Immunogenetics 43:190-195(1996).

-I- FUNCTION: IL-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, hepatocytes it induces acute phase reactants (By similarity).

-I- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IL6_PHOVI STANDARD, PRT, 209 AA. Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

1- FUNCTION: It-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants (By similarity).

hepatocytes it induces acute phase reactants (By similarity).

-IF-FUNCTION: IL-6 is a cytchkine with a wide variety of biological functions: it plays an essential role in the final differential of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, heparcocytes it induces acute phase reactants (By similarity).
